Q1) Download a sample IPL match data CSV file and load it into a new SQL table called ipl_matches using your preferred SQL tool (MySQL Workbench, DBeaver, or Azure Data Studio).

```sql
CREATE DATABASE IF NOT
EXISTS ipl_project;

USE ipl_project;

SELECT *
FROM ipl_matches
LIMIT 10;

SELECT COUNT(*) AS
total_matches
FROM ipl_matches;
```

Q2) Write a SQL query to select all matches where the team 'Mumbai Indians' played, then export the query results as a CSV file named mi_matches.csv.

```sql
USE ipl_project;

SELECT *
FROM ipl_matches
WHERE team1 = 'Mumbai
Indians'
   OR team2 = 'Mumbai
Indians';
```

Q3) Connect Microsoft Excel to your SQL database and import the ipl_matches table. Create a simple table in Excel that shows the total matches played by each team.

```sql
USE ipl_project;

SELECT team AS team_name,
       COUNT(*) AS
total_matches
FROM (
    SELECT team1 AS team
    FROM ipl_matches

    UNION ALL

    SELECT team2 AS team
    FROM ipl_matches
) AS all_teams
GROUP BY team
ORDER BY total_matches
DESC;
```

Q4) Connect Power BI Desktop to your SQL database, import the ipl_matches table, and create a pivot chart showing the number of wins for each team.

```sql
SELECT
    winner AS team_name,
    COUNT(*) AS
total_wins
FROM
    ipl_matches
WHERE
    winner IS NOT NULL
AND winner != ''
GROUP BY
    winner
ORDER BY
    total_wins DESC;
```

Q5) Use Python (with pandas and sqlalchemy) to read the mi_matches.csv file, filter matches where 'Mumbai Indians' won, and insert those rows into a new SQL table called mi_wins.

Hint: Use pandas.read_csv(), DataFrame filtering, and to_sql() for this task.

```
import pandas as pd
from sqlalchemy import
create_engine

df =
pd.read_csv("mi_matches.c
sv")

mi_wins = df[df["winner"]
== "Mumbai Indians"]

engine = create_engine(
    "mysql+pymysql://root
:YOUR_PASSWORD@localhost/
ipl_project"
)

mi_wins.to_sql(
    name="mi_wins",
    con=engine,
    if_exists="replace",
    index=False
)

print("Mumbai Indians
winning matches:")
print(mi_wins)

print("Total wins:",
len(mi_wins))
print("Data inserted
successfully into mi_wins
table.")

engine.dispose()
```
