Q1) Write an SQL query using the DISTINCT keyword to find all unique payment methods used in the orders table of a food delivery app database.

```sql
SELECT DISTINCT
payment_method
FROM orders;
```

Q2) Query the users table to list all cities where users have registered, but display each city only once and sort the result in alphabetical order (A-Z).

```sql
SELECT DISTINCT city
FROM users
ORDER BY city ASC;
```

Q3) Write an SQL query to select the top 5 most recent movie bookings from the bookings table, ordered by booking_date in descending order.

```sql
SELECT *
FROM bookings
ORDER BY booking_date DESC
LIMIT 5;
```

Q4) From a products table containing Flipkart-style product data (id, name, category, sold_count), write an SQL query to retrieve the 10 products with the highest sold_count, displaying only product name and sold_count, sorted from highest to lowest.

Hint: Use ORDER BY and LIMIT together to achieve this.

```sql
SELECT product_name,
sold_count
FROM products
ORDER BY sold_count DESC
LIMIT 10;
```
