Q1) Write an SQL query using CONCAT to combine first_name and last_name columns from a users table into a single full_name column and display the result.

```
SELECT
    CONCAT(first_name, '
', last_name) AS
full_name
FROM users;
```

Q2) Given a table called playlists with a column song_title, write a query to display all song titles in uppercase using the UPPER function.

```
SELECT UPPER(song_title)
AS song_title
FROM playlists;
```

Q3) You have a table food_items with a column item_code that sometimes contains extra spaces at the beginning or end. Write an SQL query to select item_code values after removing all leading and trailing spaces using TRIM.

```
SELECT TRIM(item_code) AS
item_code
FROM food_items;
```

Q4) In a table called movies, the column imdb_id contains codes like 'tt1234567'. Write a query to extract just the numeric part (the last 7 characters) using RIGHT and display it as movie_number.

Hint: Use RIGHT(imdb_id, 7) to get the numeric part.

```
SELECT
    RIGHT(imdb_id, 7) AS
movie_number
FROM movies;
```

Q5) A products table has a column sku_code where some entries use dashes (e.g. 'MOB-123-XY'). Write an SQL query to replace all dashes '-' with underscores '_' in sku_code using the REPLACE function and display the updated codes.

```sql
SELECT REPLACE(sku_code,
'-', '_') AS sku_code
FROM products;
```
