Q1) Write an SQL query to display the total number of orders placed by each user in a 'food_orders' table, grouped by user_id.

```
SELECT
    user_id,
    COUNT(order_id) AS
total_orders
FROM food_orders
GROUP BY user_id;
```

Q2) Using a 'transactions' table with columns (transaction_id, user_id, amount, payment_method), write an SQL query to show the total amount spent by each payment_method.

```
SELECT
    payment_method,
    SUM(amount) AS
total_amount_spent
FROM transactions
GROUP BY payment_method;
```

Q3) Given a 'movies' table with columns (movie_id, genre, box_office_collection), write an SQL query to display each genre and its total box_office_collection, but only show genres where the total collection is above 10 crore.

Hint: Use GROUP BY and HAVING together to filter the aggregated results.

```
SELECT
    genre,
    SUM(box_office_collec
tion) AS total_collection
FROM movies
GROUP BY genre
HAVING
SUM(box_office_collection
) > 10;
```

Q4) Suppose you have a 'playlist' table with columns (playlist_id, user_id, song_id, duration). Write an SQL query to find users who have created playlists with a combined song duration of more than 2 hours (7200 seconds), showing user_id and total duration.

```sql
SELECT
    user_id,
    SUM(duration) AS
total_duration
FROM playlist
GROUP BY user_id
HAVING SUM(duration) >
7200;
```
