Q1) Open your SQL editor and run a query to select all columns from a table named restaurants using SELECT * FROM restaurants;.

```sql
select * from restaurant;
```

Q2) Write an SQL query to display only the name and rating columns from the table zomato_reviews.

```sql
select name, rating from
zomato_reviews;
```

Q3) Write an SQL query to select the movie_name and release_year columns from a table called movies, but rename movie_name as 'Title' and release_year as 'Year Released' in the output using the AS keyword.

```sql
SELECT
    movie_name AS
'Title',
    release_year AS 'Year
Released'
FROM movies;
```

Q4) In a table called products, write an SQL query that selects all columns and add a comment in your SQL code explaining what the query does.

```sql
-- This query selects all
columns from the products
table.

SELECT * FROM products;
```
