Q1) Install MySQL Community Server on your computer and take a screenshot of the MySQL installer completion window.

Q2) Open MySQL Workbench or DB Browser, connect to your local MySQL server, and create a new database called music_streaming_db.

```
CREATE DATABASE music_streaming_db;
```

Q3) Write the SQL command to create a new database named food_delivery_db and execute it in your SQL Workbench or DB Browser. Use the CREATE DATABASE statement.

```
CREATE DATABASE food_delivery_db;
```

Q4) List 3 differences between MySQL and PostgreSQL in terms of features or use cases, and give one example of a popular app or company that uses each.

Feature	MySQL	PostgreSQL
1. Performance and use cases	Commonly used for websites, web applications, and read-heavy workloads.	Often chosen for complex queries, analytical workloads, and advanced data processing.
2. Advanced features	Supports transactions, indexes, views, triggers, and stored procedures.	Offers advanced features such as custom data types, extensible operators, and sophisticated indexing.
3. Data types and flexibility	Supports common data types and JSON, making it suitable for many web applications.	Supports a broader range of specialized types, including arrays, JSONB, and user-defined types.
